

# **A NEW TREATMENT** for **Arthritis** and **Tendonitis**

Regenerative Injection Treatment (RIT) stimulates the repair of damaged tendons, ligaments and cartilage using the patient's own cells, whether concentrated platelets (PRP) or stem cells derived from one's own fat or bone marrow. The procedure is done in the office and the entire process takes less than 2 hours.

If physical therapy, medications, cortisone injections and even surgery haven't worked for you then RIT may be the right option.

Virtually any chronic sprain, strain or joint pain can be successfully treated without surgery.
